part 3 segementation of green var

January 23, 2025

1 Introduction

In this part of the analysis, we focused on reassigning individuals into the identified clusters using illustrative variables. Building on the clustering results from the first step, we evaluated two algorithms, Random Forest and Gradient Boosting. Here, we focus on the segmentation of the green variables. In the first part, using the orange variables and then using a specific set of variables.

```
[1]: import pandas as pd

1.6.1 Conclusion

In this part of the analysis, we reassigned individuals to their respective clusters using the illustrative variables derived from the Green segmentation. The segmentation yielded pretty average performance when using either the Green variables or the specific given variables. Optimizing hyperparameters did not significantly improve the results, with accuracies of approximately 0.6 for the Green variables and 0.7 for the specific given variables.

Both Random Forest and Gradient Boosting produced similar results, with a difference of only 0.01 in accuracy in each case. Given this negligible difference and the fact that Random Forest is a

faster algorithm, it is the recommended choice, as the slight performance improvement offered by Gradient Boosting does not justify the additional computational cost.
